“We have experimentally proved that Listerine is a powerful antiseptic, preventing the development of bacteria and decomposition of vegetable infusions.”—*British Medical Journal*, May 3, 1890.

LISTERINE

*A safe, non-poisonous, unirritating
antiseptic solution*

LISTERINE is particularly useful in the treatment of abnormal conditions of the mucosa, and admirably suited for a wash, gargle, or douche, in catarrhal conditions of the nose and throat.

LISTERINE in proper dilution may be freely and continuously used without prejudicial effect, either by injection or spray, in all the natural cavities of the body.

LISTERINE embodies a two-fold antiseptic effect, in that after the evaporation of its volatile constituents—thyme, eucalyptus, mentha, gaultheria, and ethyl alcohol—a film of boracic and benzoic acids remains upon the surface to which Listerine has been applied, affording more prolonged antiseptic protection.

LISTERINE is a trustworthy surgical dressing; it has no injurious effect upon the tissues in which the healing process is going on.

LISTERINE in teaspoonful doses will often afford relief in fermentative dyspepsia, and is largely prescribed, with excellent results, in the various forms of diarrhoea occurring in infants and adults.

LISTERINE literature, including special pamphlets upon *Respiratory Diseases*, may be had, by physicians, upon application to

CONTRIBUTORS TO THIS NUMBER.

Sir StCLAIR THOMSON. Mr. MACLEOD YEARSLEY. Capt. ARCHER RYLAND.
Mr. A. J. BRADY. Mr. H. CLAYTON FOX.

ANTI-CATARRH VACCINE (Prophylactic).

Prepared in the Vaccine Laboratory of St. Mary's Hospital, London (Founder—Sir A. E. Wright, M.D., etc.), and supplied to the Medical Profession through the agency of **PARKE, DAVIS & CO.**

This vaccine is adapted for the preventive inoculation of individuals who suffer from recurring "colds," in cases in which a bacteriological investigation is not convenient, and in cases where there is some general diminution in resistance, indicated by the patient becoming infected by any one of the several microbes which may cause these catarrhs. It is not intended to replace an autogenous vaccine in the case of patients who are subject to the periodic lighting up of a chronic infection by some one microbe.

Each c.c. of the vaccine contains :—

<i>Micrococcus catarrhalis</i> ...	100 millions.	<i>Staphylococcus</i> ...	500 millions.
<i>B. pneumoniae</i> (Friedländer) ...	100 millions.	<i>Bacillus septus</i> (diphtheroid) ...	50 millions.
<i>Pneumococcus</i> ...	50 millions.	<i>Bacillus influenzae</i> ...	300 millions.
	<i>Parodontal Streptococcus</i>	12 millions.	

DOSE.—0.5 c.c. for the initial dose ; 1 c.c. to be given fourteen days after the first dose, and subsequently at monthly intervals during the winter. This vaccine may produce a marked local reaction if injected into muscular tissue ; it should be administered subcutaneously.

The vaccine is supplied in bulbs of about 1 c.c., also in bottles of 10 and 25 c.c.

Particulars of other vaccines (including a MIXED VACCINE FOR TREATMENT OF COLDS) issued by the St. Mary's Hospital Vaccine Laboratory will be sent to any Medical Man, on request, by the Sole Agents—

PARKE, DAVIS & Co., 50-54, Beak St., **LONDON, W.**

Journal of State Medicine.—"No medical man can afford to do without this Annual."

Glasgow Medical Journal.—"The amount of information contained in the volume is almost incredible, and nothing of the nature of new discovery has been omitted."

Journal of the Royal Naval Medical Service.—"The work is invaluable to those wishing to keep pace with modern theory and practice, and should be carefully read."

New York Medical Journal.—"The general practitioner may well feel grateful for this work, even if he has been a fairly diligent reader of the medical periodicals."
