

steps were completed in May 2022 and the team began to identify studies that could benefit from this collaboration. Given that all credentialing and access needs were in place, the team was able to initiate the study and complete all study requirements, from sample identification to data collection and clean up, in five weeks. **DISCUSSION/SIGNIFICANCE:** Workforce shortages of experienced clinical research coordinators make it imperative to overcome barriers presented by institutional rules in order to efficiently utilize available resources to conduct high quality research. The CTSA provides the perfect opportunity for partner institutions to develop processes to allow support across sites.

The Hatchery, a Universal Approach for Incubator Space in Academia

Rena Hale, Maarten Rotman, Anu Sreedhar, Stephen Ekker
Mayo Clinic

OBJECTIVES/GOALS: The goal of the Hatchery is a new approach to de-risk innovative life science ideas within an entrepreneurial setting. The Hatchery creates value by vetting the initial potential through experimental testing. **METHODS/STUDY POPULATION:** In this study we took a functioning wet laboratory space that was vacant due to principle investigator movement, and created a pipeline for its use in life science startup formation. A functioning laboratory can remain unoccupied for a notable period with transitions of research leadership. At the same time, a life science startup company who is testing core principles of their technology need wet lab space at an affordable cost. Our solution called the Hatchery provides startup companies a state-of-the-art wet laboratory space, next to a research hospital, for a very short duration of time and minimal fee. This novel approach allows preliminary validation of a technology for initial NIH SBIRs and STTRs funding pathways. **RESULTS/ANTICIPATED RESULTS:** Initial findings demonstrated the effectiveness of the Hatchery method. Our pilot study included five different life science startups company tenants. Each company was enabled to de-risk technologies and secure a phase 1 SBIR/ STTR funding or resulted in an exit via acquisition. **DISCUSSION/SIGNIFICANCE:** Entrepreneurship is a growing approach for testing and expanding new research areas. The Hatchery model makes use of existing space and infrastructure, can scale with an entrepreneurial community, and can serve as critical pilot data for a more permanent space commitment.

Utility of a Team Science and Project Management Approach to Providing Effective Participant Recruitment Support to Research Teams: The Indiana CTSI Recruitment Concierge Service (RCS)

Brenda L. Hudson, Gina Claxton, Angela Anderson, Lynsey Delp, J. Carmel Egan, Sarah Wiehe, Sharon Moe
Indiana CTSI, IU School of Medicine

OBJECTIVES/GOALS: Evaluate effectiveness of participant recruitment service to improve study enrollment through customer feedback surveys and recruitment data obtained by research teams utilizing services. Use survey information to conduct gap analysis of additional support needed for participant recruitment. **METHODS/STUDY POPULATION:** Participant enrollment is often cited as one of the most challenging aspects of clinical research. In 2021, the Indiana CTSI used project management techniques to

design and pilot a Team Science approach for providing participant recruitment support to clinical research teams. This service called the Indiana CTSI Recruitment Concierge Service (RCS) is comprised of recruitment, community engagement, social media, communications, and project management expertise. Additional experts are chosen to participate based on the study needs (regulatory, population insight, informatics, clinical services, etc.) RCS customers are comprised of study teams from a variety of areas and research experience. These customers are sent surveys to evaluate the support they received and provide suggestions for improvement. **RESULTS/ANTICIPATED RESULTS:** The RCS assisted 72 study teams in 2021 and 85 (as of November) in 2022. These studies were referred via word of mouth as no advertising of the service had been done to date. All customers were provided a study specific consultation with recommendations of services and resources that would assist their study. Some services recommended were: local study listing and volunteer registry (All IN for Health), digital marketing support, materials design expertise, community engagement and healthcare patient recruitment guidance. The overall feedback from RCS customers has been positive with most teams indicating the support improved their study recruitment and/or engagement plan. RCS will use information obtained to develop a strategy for prioritizing services due to the overwhelming number of requests received. **DISCUSSION/SIGNIFICANCE:** Using project management techniques and a Team Science approach, the Indiana CTSI was able to develop a comprehensive participant recruitment service that integrates clinical research operations, community engagement, and informatics expertise to design study specific recruitment plans and coordination of services.

Housing and Environmental Exposures: A Systematic Literature Review on Research and Policy Implications

Aarti C. Bhat, Andrew Fenelon
The Pennsylvania State University

OBJECTIVES/GOALS: Poor housing conditions and quality can be linked with residents' environmental exposures, which may contribute to a variety of adverse health outcomes. This systematic literature review will examine literature around housing, environmental exposure, and health; and policy implications to reduce the impact of housing on environmental exposures. **METHODS/STUDY POPULATION:** This systematic literature review will identify and evaluate published peer-reviewed articles as well as governmental and NGO policy briefs relating to connections between housing quality and condition, neighborhood characteristics, and environmental exposures (e.g., lead poisoning, secondhand smoke, PFAS chemicals) in the United States; and will particularly focus on health implications of such environmental exposures, racial/ethnic and socioeconomic disparities in exposure, and current and future policy recommendations to alleviate the association between housing and environmental risk. A computerized literature search of relevant electronic databases (e.g., PubMed, Sociological Abstracts, EPA database, Congressional database) for literature published after 2000 will be conducted. **RESULTS/ANTICIPATED RESULTS:** The findings from this literature review will be split up into categorizations around (1) the contribution of housing/neighborhoods on resident
