

Ancient Diseases

The elements of palaeopathology

SRBOLJUB ŽIVANOVIĆ

Translated by LOVETT F. EDWARDS

Archaeologists and physical anthropologists have always had difficulty in understanding the true meaning and significance of different pathological signs in human remains from archaeological sites. Many mistakes have occurred simply because of a lack of medical knowledge. This book is a comprehensive text in palaeopathology for students and professionals written from a medical standpoint.

Medical terminology used to describe the archaeological evidence of disease is fully explained, and reliability of every sign of disease is tested, compared and proved on actual archaeological specimens, most of which come from the author's own field work. The book sets out the material and methods for palaeopathological studies while the largest part is devoted to description of the diseases and pathological signs on bones and soft tissues.

Cambridge Monographs on the History of Medicine

Joan Baptista Van Helmont

Reformer of Science and Medicine

WALTER PAGEL

Only comparatively recently have historians begun to recognise the importance and influence of Van Helmont (1579-1644) in the history of medicine and chemistry. His theories on the nature of life, biological time, physiology and disease, the structure of matter and the processes of chemical change are veiled in his writings by a brand of Renaissance mysticism rendering them obscure to the modern reader. Dr Pagel here re-integrates Van Helmont's ideas with their original context to provide the first full-length assessment of his place in the history of European scientific and medical thought.

From Medical Chemistry to Biochemistry

The Making of a Biomedical Discipline

ROBERT KOHLER

This detailed history of the emergence of biochemistry as a discipline separate from "medical chemistry" provides a penetrating study of institution building and entrepreneurship in science. By discussing the subject within the framework of institutions, the author presents a view of the political economy of modern science and the ways in which science interrelates with social service roles and professional ideologies.
