

# ESSENTIAL READING FROM CAMBRIDGE

## **Diseases of the Nervous System in Childhood**

*Jean Aicardi*

Offers a comprehensive description of the neurological disorders of children as well as all significant diseases of the central and peripheral nervous systems from the fetal period to adolescence.

*Clinics in Developmental Medicine 115-118*  
*Published in North America by agreement with Mac Keith Press*

1992 1425 pp. 41273-0 Hardcover \$160.00

## **Essentials of Neural Development**

Second Edition

*M. C. Brown, W. G. Hopkins, and R. J. Keynes*

This up-to-date account of the development of the nervous systems in invertebrates and vertebrates emphasizes fundamental concepts.

1991 186 pp. 37698-X Paper \$29.95

## **Emerging Visions of the Aesthetic Process**

In Psychology, Semiology, and Philosophy

*Edited by Gerald C. Cupchik and János László*

Explores the underlying aesthetic processes and play from the perspectives of psychologists, philosophers, and semiologists.

1992 343 pp. 40051-1 Hardcover \$49.95

## **The Neurophysiological Examination of the Newborn Infant**

*Edited by J. A. Eyre*

Provides an up-to-date description of the application of neurophysiological examination techniques and evaluates their importance in the care of newborn babies.

*Clinics in Developmental Medicine 120*  
*Published in North America by agreement with Mac Keith Press*

1992 217 pp. 41276-5 Hardcover \$54.95

## **Night Vision**

Basic, Clinical and Applied Aspects

*Edited by R. F. Hess, L. T. Sharpe, and K. Nordby*

Details up-to-date book describes the light and dark adaptation of receptor and post-receptor mechanisms from a number of perspectives.

1990 562 pp. 32736-9 Hardcover \$125.00

## **Cambridge Medical Reviews**

Neurobiology and Psychiatry

Volume 1

*Edited by Robert Kerwin, David Dawbarn, James McCulloch, and Carol Tamminga*

Presents an evaluation and dissemination of information on recent developments concerning the fundamental aspects of biological psychiatry.

*Cambridge Medical Reviews: Neurobiology and Psychiatry 1*

1992 188 pp. 39442-9 Hardcover \$69.95

## **Successful Lab Reports**

A Manual for Science Students

*Christopher S. Lobban and Maria Scheffer*

Bridges the gap between the many books about writing term papers and the advanced books about writing papers for publication in scientific journals.

1992 106 pp. 40404-5 Hardcover \$34.95  
40741-9 Paper \$12.95

## **An Introduction to the Modelling of Neural Networks**

*Pierre Peretto*

Examines what neural networks can reveal about brain function as well as the implications for psychology, artificial intelligence and computer design.

*Collection Aléa-Saclay: Monographs and Texts in Statistical Physics 2*

1992 491 pp. 41451-2 Hardcover \$100.00  
42487-9 Paper \$39.95

Now in paperback...

## **Modelling Brain Function: The World of Attractor Neural Networks**

*Daniel J. Amit*

"...regard this book as an opening of a discussion—undoubtedly a very qualified one."

—*Journal of Mathematical Psychology*

504 pp. 42124-1 Paper \$24.95

Available in bookstores or from

**THE NEUROBIOLOGY  
OF NEURAL  
NETWORKS**

*edited by Daniel Gardner*

This timely overview and synthesis of recent work in both artificial neural networks and neurobiology seeks to examine neurobiological data from a network perspective and to encourage neuroscientists to participate in constructing the next generation of neural networks.

Computational Neuroscience series  
A Bradford Book 248 pp., 60 illus.  
\$45.00

**CONTRAST  
SENSITIVITY**

*edited by Robert Shapley and  
Dominic Man-Kit Lam*

This book is the first to focus on the importance of image contrast to vision, including the neural basis for the extremely high sensitivity of human observers to contrast.

Proceedings of the Retina Research  
Foundation Symposia, Volume 5  
A Bradford Book 300 pp., 160 illus.  
\$85.00

**VISION, BRAIN, AND  
BEHAVIOR IN BIRDS**

*edited by H. Philip Zeigler and  
Hans-Joachim Bischof*

The visual capacities of birds rival even those of primates, and their visual system probably reflects the operation of a ground plan common to all vertebrates. This book provides the first comprehensive and current review of considerable progress made over the past decade in analyzing neural and behavioral mechanisms mediating visually guided behavior in birds.

A Bradford Book 460 pp., 119 illus.  
\$75.00

**DIGITAL IMAGES AND  
HUMAN VISION**

*edited by Andrew B. Watson*

These fifteen contributions by distinguished vision and imaging scientists explore the role of human vision in the design of modern image communication systems. A dominant theme in the book is image compression — how compression algorithms can be designed to make best use of what we know about human vision.

A Bradford Book 320 pp., 168 illus., 3 in  
color \$65.00

## DETAILED INFORMATION FOR CONTRIBUTORS

**AIMS AND SCOPE.** *Visual Neuroscience* publishes papers based on original experimental or theoretical work concerned explicitly with the biological substrates of vision, including the neural mechanisms involved in visually guided behavior and perception. Studies based exclusively on clinical, psychophysical, or behavioral methods will be considered only if they speak directly to issues of neural mechanisms. The journal features full-length research reports and review articles as well as short communications.

**ORIGINALITY AND COPYRIGHT.** To be considered for publication in *Visual Neuroscience* a manuscript cannot have been published previously, nor can it be under review for publication elsewhere. Papers with multiple authors are reviewed with the assumption that all authors have approved the submitted manuscript and concur in its submission to *Visual Neuroscience*. A Transfer of Copyright Agreement must be executed before an article can be published. Government authors whose articles were created in the course of their employment must so certify in lieu of copyright transfer. Authors are responsible for obtaining written permission from the copyright owners to reprint any previously published material included in their article.

**MANUSCRIPT SUBMISSION AND REVIEW.** An original and three high quality photocopies should be submitted to:

James T. McIlwain, Editor  
*Visual Neuroscience*  
Brown University, Box G-M416  
Providence, RI 02912, USA

Subsequent correspondence should refer to the Manuscript Reference Number, which will appear on the Acknowledgment Card sent to the corresponding author. Each manuscript will normally be reviewed by at least two referees with relevant scientific experience. Authors may suggest appropriate reviewers, but final selection of referees will be made by the Editor. Reviewers are asked to evaluate manuscripts for their scientific merit and clarity of presentation and to voice any concerns related to the welfare of animal and human subjects. Every effort will be made to notify authors of the reviewers' recommendations within six weeks of receipt of a manuscript.

**MANUSCRIPT LENGTH AND EXCESS PAGE CHARGES.** Due to space limitations, concisely written papers are more likely to receive favorable review than those judged to be excessively long. Page charges are not levied for articles occupying fewer than 12 printed pages (i.e. double-spaced manuscripts of approximately 40 pages or less, using standard, uniformly spaced typefaces, and including figures), but authors will be asked to pay \$100 for each printed page beyond 12. Editorial review and publication of a paper are not contingent upon the payment of page charges.

Manuscripts submitted as Short Communications should normally occupy no more than 4 printed pages, figures included (approximately 13 manuscript pages).

**MANUSCRIPT PREPARATION AND STYLE.** Manuscripts must be in English and typed double-spaced on one side only of 8½ × 11" or A4 size good quality paper. Allow margins of at least 1" (20 mm); use a 5-space paragraph indent; do not hyphenate words at the end of lines and do not justify right margins. Minor corrections to the manuscript may be typed or neatly printed in ink; retyping is required for significant changes. Numbers should be spelled out when they occur at the beginning of a sentence; use Arabic numerals elsewhere. Abbreviations should be used sparingly and nonstandard abbreviations should be defined at their first occurrence. Metric system (SI) units should be used. Manu-

scripts that do not conform to the style of *Visual Neuroscience* will be returned without review.

**MANUSCRIPT ELEMENTS AND ORDER.** Unless there are obvious and compelling reasons for variation (e.g. review articles, short communications), manuscripts should be organized as follows:

**Title page.** This is page 1. The title should be concise, informative, and free of abbreviations, chemical formulae, technical jargon, and esoteric terms. This page should include (a) the article's full title, (b) names and affiliations of all authors, (c) the name, mailing address, and telephone number of the corresponding author, (d) the address for reprint requests if different from that of the corresponding author, (e) a short title of 50 characters or less, and (f) a list of the number of manuscript pages, number of tables, and number of figures.

**Abstract and keywords page.** This is page 2 and should include (a) the article's full title, (b) an abstract of no more than 300 words, and (c) up to 5 keywords or phrases that reflect the content and major thrust of the article. The abstract should give a succinct account of the objective, methods, results, and significance of the research.

**Introduction.** This section begins on page 3 and should clearly state the objective of the research in the context of previous work bearing directly on the subject. An extensive review of the literature is not usually appropriate.

**Methods.** This section should be brief but provide sufficient information to permit others to replicate the study. Pertinent details of species, apparatus and equipment, procedures and experimental design should be described.

*All experiments involving human subjects must be conducted in accordance with principles embodied in the Declaration of Helsinki (Code of Ethics of the World Medical Association). Experiments involving animal subjects must conform to the principles regarding the care and use of animals adopted by the American Physiological Society and the Society for Neuroscience. The editor may refuse papers that provide insufficient evidence of adherence to these principles.*

**Results.** The results should be presented clearly and concisely, using figures and tables to summarize or illustrate the important findings. Quantitative observations are often more effectively displayed in graphs than in tables.

**Discussion.** The discussion should summarize the major findings and explain their significance in terms of the study's objectives and relationship to previous, relevant work. This section should present compact, clearly developed arguments rather than wide-ranging speculation or uncritical collation of earlier reports.

**Acknowledgments.** Use a separate page to recognize the contributions of individuals and supporting institutions.

**References.** *Visual Neuroscience* uses the author-date reference style of the *Journal of Physiology*. In the text, references should be cited as follows:

as shown by Herrick (1948)  
(Gordon et al., 1973)  
(Buhl & Peichl, 1986; Gordon et al., 1987)

The alphabetical list of references begins a new page, and must be typed double-spaced. Each in-text citation must have a corresponding reference and vice versa. List works by different authors who are cited within the same parentheses in chronological order, beginning with the earlier work. Journal titles should not be abbreviated. Only published articles and articles in press should appear in this list. Responsibility for the accuracy of references cited lies with the authors. Brief examples:

### Journal article

Buhl, E.H. & Peichl, L. (1986). Morphology of rabbit retinal ganglion cells projecting to the medial terminal nucleus of the accessory optic system. *Journal of Comparative Neurology*, 253, 163-174.

### Book

Herrick, C.J. (1948). *The Brain of the Tiger Salamander*. Chicago: University of Chicago Press.

### Chapter in an edited book

Bonds, A.B. & DeBruyn, E.J. (1986). Inhibition and spatial selectivity in the visual cortex: The cooperative neuronal network revisited. In *Models of Visual Cortex*, ed. Rose, D. & Dobson, V.G., pp. 292-300. Chichester, England: John Wiley & Sons.

For more than one work by the same author(s) published in the same year, use (Jones, 1986a, 1986b) in text and likewise in the reference section.

**Tables.** Tables should be numbered consecutively with Arabic numerals and each should be typed double-spaced on a separate sheet. All tables are to be grouped together after the references. A short explanatory title and column headings should make the table intelligible without reference to the text. All tables must be cited and their approximate positions indicated in the text.

**Figures and legends.** The number of figures should be the minimum necessary to make the essential points of the paper. Figures should be supplied no larger than 8 × 10" (approx. 200 × 250 mm) and must be camera-ready. Photographs for halftone reproduction must be on white glossy paper. Figures should be composed to occupy a single column (8.3 cm) or two columns (17 cm) after reduction. Diagrams and illustrations must have a professional appearance and be typed or drawn with sharp, black lettering to permit reduction. To assure legibility, letters, numbers, and symbols on figures should have a minimum height of 1 mm when reduced. Photomicrographs must include a calibration bar; if symbols are used on micrographs, they must contrast sufficiently with the background to be clearly visible when printed. Photocopies of micrographs are not acceptable for review purposes.

Artwork should normally be in black and white; if authors have color figures, the publisher will provide a price quotation for the additional production costs. All figures must be identified on the back with the short title of the paper, figure number, and figure orientation (top or bottom). Preferably, figures should be mounted on heavy sheets of the same size as the manuscript. Four complete sets of figures should be carefully packaged in protective envelopes, one to accompany each copy of the manuscript. Each figure must be cited and its approximate position clearly indicated within the text.

Figures must be numbered consecutively with Arabic numerals and be accompanied by a descriptive caption typed double-spaced on a separate sheet. The captions, collected at the end of the manuscript, should concisely describe the figure and identify any symbols and/or calibration bars.

**COPYEDITING AND PAGE PROOFS.** The publisher reserves the right to copyedit manuscripts to conform to the style of *Visual Neuroscience*. The corresponding author will receive page proofs for final proofreading. No rewriting of the final accepted manuscript is permitted at the proof stage, and substantial changes may be charged to the authors.

**OFFPRINTS.** The corresponding author will receive 25 free article offprints. A form will accompany the page proofs allowing orders for complete copies of the issue and for the purchase of additional offprints. Offprint requirements of all coauthors should be included on this form. Orders received after issue printing will be subject to a 50% reprint surcharge.
